

ABSTRACT OF THE DISCLOSURE

A head drum assembly of a tape recorder is disclosed. A rotor case is directly bonded to a rotary drum, a spacer interposed between a magnet yoke and a stator coil of
5 a motor stator is removed, and a predetermined gap is formed between the magnet yoke and the stator coil. As a result, it is possible to remove a rotor bush and a spacer from the component list of the conventional construction and to exclude the assembling steps thereof, whereby assembling the head drum assembly is easier and the cost of manufacturing is reduced.
